Introduction

The Minimum  
Copy Number  
Generation  
Problem

Other formulations

A greedy solution for  
the MCNG Problem

Conclusions

- Some tumor types' hererogeneity is better reflected in the genomic rearrangements and duplications rather than small mutations.
- Easier to produce phylogeny on copy number profiles (CNPs) than genomic data in such cases.
- Need to be able to compute the minimum number of duplications/deletions to transform one profile into another.

## Definition 7 (MCNG Problem)

Given a genome  $G$  and a copy number profile  $H$ , is there a sequence of at most  $k$  operations that can convert  $G$  into some  $G'$  such that  $\text{cnp}(G') = H$ ?

We can easily constrain the problem in many ways:

- Tandem duplications only
- Exemplar genomes only
- No deletions

the MCNG Problem

Conclusions

## Theorem 2

*The MCNG problem when duplications must be tandem is NP-Hard*

We show this by reducing from the exact cover by 3-sets problem (X3C).

## Definition 8 (X3C)

Given  $S = \{S_1, S_2, \dots, S_m\}$  s.t.  $|S_i| = 3$  and  $S_i \subseteq X = \{x_1, x_2, \dots, x_n\}$  and  $|X| = 3q$ , is there a selection of  $q$  3-sets  $S_i$  such that their union is the base set  $X$ ?

# Reduction

Transform an instance of X3C to MCNG by creating a genome  $G$  such that

$$G = \langle T_1, p_1, T_2, p_2, \dots, p_{m-1}, T_m \rangle$$

- Each  $T_i$  corresponds to the elements in  $S_i$  and each  $p_i$  is a peg gene.
- Let  $f(x_i)$  denote the frequency of  $x_i$  in the multiset of  $\bigcup_j S_j$ .
- For each  $p_i$ , we set the target copy number to 1.
- For each  $x_i$ , we set the target copy number to  $f(x_i) + 1$ .

Introduction

The Minimum  
Copy Number  
Generation  
Problem

Other formulations

A greedy solution for  
the MCNG Problem

Conclusions

Transform an instance of X3C to MCNG by creating a genome  $G$  such that

$$G = \langle T_1, p_1, T_2, p_2, \dots, p_{m-1}, T_m \rangle$$

- Each  $T_i$  corresponds to the elements in  $S_i$  and each  $p_i$  is a peg gene.
- Let  $f(x_i)$  denote the frequency of  $x_i$  in the multiset of  $\bigcup_j S_j$ .
- For each  $p_i$ , we set the target copy number to 1.
- For each  $x_i$ , we set the target copy number to  $f(x_i) + 1$ .

## Remark 3

*We can obtain a duplication of  $T_i, T_{i+1} \dots T_j$  in  $j - i + 1$  operations. Therefore we have an average of 1 operation per  $T$  block.*

# Proof

Problem

Other formulations

A greedy solution for  
the MCNG Problem

Conclusions

## Lemma 4

*Let  $G'$  be obtained from  $G$  with the allowed operations and  $cnp(G') = H$ . Let  $t = G' - G$  and  $|t| = 3q$  and  $cnp(t) = I_{3q}$ . Then*

*$t$  is canonical (a concatenation of  $T_i$ s obtained by canonical operations)  $\iff t$  is obtained with  $q$  allowable operations from  $G$ .*

## Corollary 5

*If the MCNG problem admits a solution of  $q$  tandem duplication or deletion operations, then the X3C instance has a solution.*

# Proof ctd

## On the Minimum Copy Number Generation Problem in Cancer Genomics

Zhihui Liu,  
and Binhai  
Zhu

Introduction

The Minimum  
Copy Number  
Generation  
Problem

Other formulations  
A greedy solution for  
the MCNG Problem

Conclusions

## Forward.

As we showed earlier, we can obtain each  $T_i$  with 1 operation on average. □

## Backward.

If  $t$  is not obtained in a canonical way, then at least one  $T$  block is obtained using a non-canonical operation. However, this would mean that  $T$  is obtained using more than one operation. Since there are still  $q - 1$  other  $T$  blocks to obtain, then at this point we need at least  $q + 1$  total operations to obtain them all. □

# Exemplar case

Zhu

### Introduction

### The Minimum Copy Number Generation Problem

#### Other formulations

A greedy solution for  
the MCNG Problem

### Conclusions

- Duplication-heavy vs deletion-heavy simulations didn't make a significant difference in algorithm performance.
- Performance dropped with increase in  $k$ ,  $m$ , and duplication/deletion size.
- Initial seed is always a permutation of  $GG$  i.e. a permutation of a doubling of  $G$ .

Introduction

The Minimum  
Copy Number  
Generation  
Problem

Other formulations

A greedy solution for  
the MCNG Problem

Conclusions

- MCNG with tandem duplications is NP-Hard, but are there any approximation or FPT algorithms for it?  
MCNG( $\geq$ )( $\leq$ ) we know is only approximable to  $O(\log n)$  and has no FPT.
- The Exemplar MCNG with duplications only is tractable when the desired CNP is all powers of 2. It is open whether or not it is polynomially solvable when the desired CNP is arbitrary.
- The MCNG problem with no restrictions is open.
